

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

IV. *Two Cases of Insects voided by the urinary Passage, communicated in a Letter to the Publisher, by Dr. Daniel Turner, Coll. Med Lond. Lic.*

Dec. 6. 1725.

ON the 24th of *November* last, a poor Woman, in my Neighbourhood, came to crave my Advice for her Grand-child, an Infant of about 16 Months old, bringing with her a Worm, which she told me the Apothecary had just then drawn out of the Child's *Penis*, who had for several Days before labour'd under great Uneasiness; which (as usually term'd by these People) she call'd Convulsions of the Bowels. The Infant was continually drawing up the lower Limbs, and straining at both Sphincters; the Urine seemed to pass with Difficulty for some Days, till at last there came on a total Suppression, and the Worm, advancing, shew'd itself at the Extremity of the *Urethra*, when the Apothecary was called up to help them. I examined the Insect, and found it measur'd above 4 Inches, resembling the Worms usually excretn'd *per Podicem*, of the Earth-worm Kind, but whiter; which made me think at first they had been mistaken, and that the same had been that Way excreted. Having directed what I thought proper, I went to the Apothecary, who has the Worm now in his Custody, to be better inform'd. He assures me, that, when he came to the Child, he saw a preternatural Body, which at first he knew not what to make of, hanging half an Inch out of the *Glans*, and lying double in the Passage: Perceiving it farther advancing, he took hold of it, and with little Difficulty drew forth the same.

The Summer before the last, a Woman show'd me an Insect of the Maggot Species, with a crusty red *Galea* over the Snout, and a crescent or forked Tail, which she had just then voided by the urinary Passage.

V. *An Account of a new Machine, called the Marine Surveyor, contrived for the Mensuration of the Way of a Ship in the Sea, more correctly than by the Log, or any other Method hitherto used for that Purpose; together with several Testimonials, setting forth the Usefulness of this Invention. By Mr. Henry de Saumarez of the Island of Guernsey.*

HAVING for several Years applied my Studies to the Improvement of Navigation, I have fallen on various Projects, as well for the better clearing a Ship off a Lee-shore, as for her Steering, Tacking, or Waring, &c. which I may probably soon publish to the World: But what has most of all employ'd my Thoughts, has been to contrive something to ascertain the Way of a Ship in the Sea, more correctly than by the Log, (at present in Use in our Navigation;) the Errors of which are such, that I am fully persuaded the unhappy Fate of the brave Sir *Cloudsley Shovell*, was more owing thereto, than to any Errors in Judgment. The melancholy Reflections I made on that national Loss, was what spur'd me on to find out something that would not only have a regular Motion under Water, but might communicate the same to a Dial, or Piece of Clock-Work, within the Ship.
